

The Science of Magic

You know, there is magic, and then, there is magic. Just because we interpret something to be “hocus-pocus” does not make it to be entirely false. Magic is definitely real, it's just not what we expect it to be.

We live in a grandiose universe. The powers surrounding us are awesome and amazing. Even with our best secret technologies and clandestine sciences, we haven't got a clue as to what is really out there.

What yesterday we called the supernatural and the metaphysical, today we call science. Tomorrow, what we today call the supernatural and metaphysical, we will then also call science and use as technology.

Know then this great rule: there is no difference between the natural and the supernatural, there is no difference between the physical and the metaphysical. They are all part and parcel of the laws of nature established in the beginning (whatever and whenever that was), by the Creator (whatever “It” really is).

The only difference between the natural, physical and the supernatural, metaphysical is the perceptions of humanity. What we understand we call natural and physical. What we do not understand we call supernatural and metaphysical.

Human understanding is a fluctuating thing. Human understanding is in a state of constant growth. What we once did not understand and feared, we today understand completely and embrace. We fear the unknown, but we respect the known.

Many modern technologies might have been viewed as magic in the past and subject to taboos based on fear. Yet, if we were to take our uneducated and fear-filled ancestors and explain to them the science behind the so-called magic, this understanding would have enlightened them and emancipated them from their fears. What was once unknown and feared has become known and understood. Instead of being feared, now, tools can be made and used, with knowledge of their natural law parameters.

The greatest technological tool is to this day, still, the most unknown. I speak of the human mind. Mind you! I am not speaking about the organic, physical brain. Rather, I am speaking about the inorganic mind that operates within it. To properly understand the relationship of the mind to the brain, compare it to computer hardware and software. The organic brain is the hardware, whereas the mind is the software. We can analyze the hardware brain all we want, but until we start to explore the software mind, we will never uncover and unleash all the potential powers that lie dormant within it.

Consciousness science is the doorway that connects the seen with the unseen, the physical with the metaphysical and the natural with the supernatural. Being that they are already all one and it is only the limited understanding of the mind that creates the illusions of separation, it is incumbent upon us to expand the thresholds of consciousness so as to equally expand our horizons of science.

Long ago, the wise Sages taught, where a man thinks is where he is at. Well then, let us not be so mundane! Let us travel in our minds and imaginations, and where we will go, as the saying goes, "The sky's the limit." Indeed, we will be able to say that, "Consciousness is the final frontier."

For millennium, the Sages who safeguarded ancient secrets protected a knowledge that merged the science of nature with the science of mind. They knew the ancient "hocus-pocus" and they also knew that there was nothing "hocus-pocus" about it. The ancient Sages knew they safeguarded a technology based on consciousness, and they knew how it worked. The Sages could replicate their knowledge by training new adepts and enabling them to access the same levels of consciousness, and the powers inherent therein, as had they, themselves.

Nothing has changed over the millennium. There is nothing new under the sun. What was once known is still known. What was once understood is still understood. Yet, as in the past, those seeking the knowledge are few. Those willing to make the necessary sacrifices to receive it are even fewer. And those willing to exert the discipline and to devote themselves to the training to accomplish in the end are even fewer still.

Everything is there, and everything awaits. Yet, those willing to give up their fears and their prejudices are still few and far between. Therefore, in spite of all our modern scientific discoveries, for the most part, the human race is as primitive and fear-based as were our ancient, less technologically advanced ancestors. Consciousness remains pitifully small and ignorance remains at its constant high.

Understanding requires effort. Expanding consciousness requires sacrifice. But both effort and sacrifice are hard! And maybe today, more so than in the past, people are just lazy and tired. Most do not care to make the effort. Most just want to sit back, be entertained and to be left alone. Therefore, consciousness suffers alone, in exile, abandoned and for the most part forgotten.

Yet, the Over-Mind of the Universe (God? Collective Consciousness?) does not allow such stagnation to remain unchallenged. Consciousness is software and it contains deeply imbedded programs that run autonomously. If and when consciousness detects that the hardware organic brain is not making the proper interface with the consciousness software, then consciousness itself activates and seeks autonomous expression.

Consciousness arises out of the depths of humanity's collective unconscious and taps into the inner recesses of the minds of every single human being, past, present and future.

When collective consciousness is aroused, somewhere, there is an open door, a human mind, willing to entertain it. When that connection is made, said individual becomes the receptacle for the expressions of the entire human collective consciousness. When this occurs, so many other things can occur because of it.

Human consciousness interfaces with natural law in many ways already known to us. This is how the process of scientific discovery occurs. How many scientific inventions produced from the minds (not the organic brains) of some of the best people in science have come from the imaginations of these scientists? One can read about how imagination, dreams and even visions played a great role in the discovery process of such men as Einstein and Tesla. They tapped into the great reservoir of human consciousness and discovered the foundations of what was once called (and to some still is called) magic.

Consciousness technology was the foundation of the prophetic experience that underlies the entire Biblical tradition. Prophecy was not and never was a component of religion. Indeed, there is no Biblical word for "religion" itself. The concept was a foreign one in Biblical times. Prophecy was then and still remains a consciousness technology that enables its practitioner to use the "software" of the mind to explore and discover the secrets of the universe.

Secrets of the universe do not necessarily have to remain secrets. There is absolutely no reason for them not to be revealed and then exploited. We understand natural law and use natural law to our betterment. Using supernatural law is no different. All we must do is first remove it from its dark sheath of superstition and fear. We must enable consciousness technology to naturalize the supernatural and to put it to work for us. When we accomplish this task, we, as collective humanity, will take great leaps forward towards our future destiny.

All lies before us. The path is inviting. Who is willing to commit, sacrifice and surrender to do what is necessary to better oneself and possibly thereby, the entire human race?
